HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use ADLYXIN® safely and effectively. See full prescribing information for ADLYXIN.

ADLYXIN® (lixisenatide) injection, for subcutaneous use

Initial U.S. Approval: 2016

INDICATIONS AND USAGE

ADLYXIN is a glucagon-like peptide-1 (GLP-1) receptor agonist indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus. (1)

Limitations of Use: (1)

• Has not been studied in patients with chronic pancreatitis or a history of unexplained pancreatitis. Consider other antidiabetic therapies in patients with a history of pancreatitis.

• Not for treatment of type 1 diabetes.

• Has not been studied in patients with gastroparesis and is not recommended in patients with gastroparesis.

DOSAGE AND ADMINISTRATION

Initiate at 10 mcg once daily for 14 days. On Day 15, increase dosage to 20 mcg once daily. (2.1)

Administer once daily within one hour before the first meal of the day. (2.2)

Inject subcutaneously in the abdomen, thigh or upper arm. (2.2)

Inject ADLYXIN by subcutaneous injection in the abdomen, thigh or upper arm. (2.2)

Dosage Forms and Strengths

Injection: 100 mcg/mL in a 3 mL single-patient-use prefilled pen (for 14 doses of 10 mcg per dose). (3)

Oral contraceptives should be taken at least 1 hour before ADLYXIN administration. (2.1)

Important Administration Instructions

Inspect ADLYXIN visually before use. It should appear clear and colorless. Do not use ADLYXIN if particulate matter or coloration is seen.

Instruct patients and caregivers on the preparation and use of the pen prior to first use of ADLYXIN. Training should include a practice injection.

ADVERSE REACTIONS

Severe hypersensitivity to lixisenatide or any component of ADLYXIN. (4)

WARNINGS AND PRECAUTIONS

Anaphylaxis and Serious Hypersensitivity Reactions: Discontinue ADLYXIN and promptly seek medical advice. (5.1)

CONTRAINDICATIONS

Pancreatitis: Discontinue promptly if pancreatitis is suspected. Do not restart if pancreatitis is confirmed. Consider other antidiabetic therapies in patients with a history of pancreatitis. (5.2)

Never share ADLYXIN pen between patients; even if the needle is changed. (5.3)

Hypoglycemia with Concomitant Use of Insulin Secretagogues or Insulin: Patients taking an insulin secretagogue or insulin may have an increased risk of hypoglycemia, including severe hypoglycemia. Reduction in the dose of insulin secretagogues or insulin may be necessary. (5.4)

Acute Kidney Injury: Monitor renal function in patients with renal impairment reporting severe adverse gastrointestinal reactions. ADLYXIN is not recommended in patients with end stage renal disease. (5.5)

Immunogenicity: Patients may develop antibodies to lixisenatide. If there is worsening glycemic control or failure to achieve targeted glycemic control, significant injection site reactions or allergic reactions, alternative antidiabetic therapy should be considered. (5.6)

DRUG INTERACTIONS

ADLYXIN delays gastric emptying which may impact absorption of concomitantly administered oral medications. Oral medications that are particularly dependent on threshold concentrations for efficacy, such as antibiotics, or medications for which a delay in effect is undesirable, such as acetaminophen, should be administered 1 hour before ADLYXIN. (7.1, 12.3)

Oral contraceptives should be taken at least 1 hour before ADLYXIN administration or 11 hours after the dose of ADLYXIN. (7.1, 12.3)

USE IN SPECIFIC POPULATIONS

Pregnancy: ADLYXIN should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. (8.1)

See 17 for PATIENT COUNSELING INFORMATION and Medication Guide

FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

ADLYXIN is indicated as an adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus.

Limitations of Use:

• ADLYXIN has not been studied in patients with chronic pancreatitis or a history of unexplained pancreatitis. Consider other antidiabetic therapies in patients with a history of pancreatitis. [See Warnings and Precautions (5.2)]

• ADLYXIN should not be used in patients with type 1 diabetes mellitus.

• ADLYXIN has not been studied in patients with gastroparesis and is not recommended in patients with gastroparesis.

2 DOSAGE AND ADMINISTRATION

2.1 Dosing Instructions

• The starting dose of ADLYXIN is 10 mcg subcutaneously once daily for 14 days.

• Increase the dose to the maintenance dose of 20 mcg once daily starting on Day 15.

2.2 Important Administration Instructions

• Instruct patients and caregivers on the preparation and use of the pen prior to first use of ADLYXIN. Training should include a practice injection.

• Inspect ADLYXIN visually before use. If it should appear clear and colorless. Do not use ADLYXIN if particulate matter or coloration is seen.

• Administer ADLYXIN by subcutaneous injection in the abdomen, thigh or upper arm once daily.
• Rotate injections sites with each dose. Do not use the same site for each injection.
• Instruct patients to administer an injection of ADLYXIN within one hour before the first meal of the day preferably the same meal each day. If a dose is missed, administer ADLYXIN within one hour prior to the next meal.

3. DOSE FORMS AND STRENGTHS
ADLYXIN is a clear and colorless solution available as:
Injection: 50 mcg/mL in 3 mL solution in a green single-patient-use prefilled pen (for 14 doses of 10 mcg per dose)
Injection: 100 mcg/mL in a burgundy single-patient-use prefilled pen (for 14 doses of 70 mcg per dose)

4. CONTRAINDICATIONS
ADLYXIN is contraindicated in patients with known severe hypersensitivity to lisinatid and to any component of ADLYXIN. Hypersensitivity reactions including anaphylaxis have occurred with ADLYXIN [see Warnings and Precautions (5.1) and Adverse Reactions (6.1)].

5. WARNINGS AND PRECAUTIONS
5.1 Anaphylaxis and Serious Hypersensitivity Reactions
In clinical trials of ADLYXIN, there have been cases of anaphylaxis determined to be related to ADLYXIN (frequency of 0.1% or 10 cases per 10,000 patient-years). Other serious hypersensitivity reactions including angioedema also occurred [see Adverse Reactions (6.1)].

5.2.5 Pancreatitis
Acute pancreatitis, including fatal and nonfatal hemorrhagic or necrotizing pancreatitis, has been reported postmarketing in patients treated with GLP-1 receptor agonists. In clinical trials of ADLYXIN, there were 3 cases of pancreatitis among ADLYXIN patients, and 14 cases in comparator-treated patients (incidence rate of 21 vs. 17 per 10,000 patient-years). ADLYXIN cases were reported as acute pancreatitis (n=3), pancreatitis (n=12), chronic pancreatitis (n=5), and edematous pancreatitis (n=1). Some patients had risk factors for pancreatitis as a history of cholelithiasis or alcohol abuse.

After initiation of ADLYXIN, observe patients carefully for signs and symptoms of pancreatitis (including persistent severe abdominal pain, sometimes radiating to the back and which may or may not be accompanied by vomiting). If pancreatitis is suspected, promptly discontinue ADLYXIN and initiate appropriate management. If pancreatitis is confirmed, do not restart ADLYXIN. Consider antidiabetic therapies other than ADLYXIN in patients with a history of pancreatitis.

5.3 Never Share ADLYXIN Pen Between Patients
ADLYXIN pens should never be shared between patients, even if the needle is changed. Pen-sharing increases the risk for transmission of pathogens.

5.4 Hypoglycemia with Concomitant Use of Insulin Secretagogues or Insulin
Patients receiving ADLYXIN in combination with basal insulin or insulin secretagogues (e.g., sulfonylurea) have an increased risk of hypoglycemia, including severe hypoglycemia. In patients receiving sulfonylurea with or without metformin, 14.5% patients on-ADLYXIN reported symptomatic hypoglycemia compared to 10.6% for those on placebo. In patients receiving basal insulin with sulfonylurea, 47.2% patients on ADLYXIN reported symptomatic hypoglycemia compared to 21.6% for those on placebo. In patients receiving basal insulin with or without metformin, 28.3% patients on ADLYXIN reported symptomatic hypoglycemia compared to 23.0% for those on placebo.

Inform and closely monitor patients with a history of anaphylaxis or angioedema with another GLP-1 receptor agonist for allergic reactions, because it is unknown whether such patients will be predisposed to anaphylaxis with ADLYXIN. ADLYXIN is contraindicated in patients with known hypersensitivity to lisinatid [see Contraindications (4)]. If a hypersensitivity reaction occurs, the patient should discontinue ADLYXIN and promptly seek medical attention.

5.5 Acute Kidney Injury
Acute kidney injury and worsening of chronic renal failure, which may sometimes require hemodialysis, has been reported postmarketing in patients treated with ADLYXIN. Some of these events were reported in patients without known underlying renal disease. A majority of the reported events occurred in patients who had experienced nausea, vomiting, diarrhea, or dehydration.

Monitor renal function when initiating or escalating doses of ADLYXIN in patients with renal impairment and in patients reporting severe gastrointestinal reactions. ADLYXIN is not recommended in patients with end stage renal disease [see Use in Specific Populations (8.6)].

6. ADVERSE REACTIONS
The following serious reactions are described below or elsewhere in the prescribing information:
• Anaphylaxis and Serious Hypersensitivity Reactions [see Warnings and Precautions (5.1) and Adverse Reactions (6.1)]
• Pancreatitis [see Warnings and Precautions (5.2)]
• Hypoglycemia with Concomitant Use of Insulin Secretagogues or Insulin [see Warnings and Precautions (5.4) and 5.5]
• Renal Failure [see Warnings and Precautions (5.5)]
• Immunogenicity [see Warnings and Precautions (6.6)]

6.1 Clinical Trials Experience
Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

6.2 Pool of Placebo-Controlled Trials
The data in Table 1 are derived from the placebo-controlled trials [see Clinical Studies (14)].

6.3 Gastrointestinal Adverse Reactions
In the pool of placebo-controlled trials, gastrointestinal adverse reactions occurred more frequently among patients receiving ADLYXIN than placebo (placebo 18.4%, ADLYXIN 26.4%). More patients receiving ADLYXIN (4.3%) discontinued treatment due to gastrointestinal adverse reactions than patients receiving placebo (0.5%). Investigators graded the severity of gastrointestinal adverse reactions occurring on ADLYXIN as "mild" in 64.2% of cases, "moderate" in 32.3% of cases, or "severe" in 3.5% of cases. The majority of these adverse reactions occurred during the first 3 weeks after starting treatment. In addition to the reactions in Table 1, the following adverse reactions were reported in >2% of patients and more frequently in ADLYXIN-treated patients than placebo (frequencies listed, respectively, as: placebo; ADLYXIN): dyspepsia (0.2%, 3.2%), constipation (1.8%, 2.8%), abdominal distension (0.9%, 2.2%), abdominal pain upper (0.9%, 2.2%), abdominal pain lower (1.5%, 2.0%).

Hypoglycemia
Symptomatic hypoglycemia was defined as an event with clinical symptoms that were considered to result from a hypoglycemic episode with an accompanying plasma glucose <60 mg/dL or associated with prompt recovery after oral carbohydrate, intravenous glucose, or glucagon administration if no plasma glucose value was available. Severely symptomatic hypoglycemia was defined as an event with clinical symptoms that were considered to result from hypoglycemia in which the patient required the assistance of another person, associated with a plasma glucose level below 36 mg/dL; or, associated with prompt recovery after oral carbohydrate, intravenous glucose, or glucagon administration if no plasma glucose was available.

6.4 Others
Table 2 summarizes the incidence of symptomatic hypoglycemia and severe hypoglycemia in seven placebo-controlled efficacy/safety studies.

6.5 Immunogenicity
Patients may develop antibodies to lisinatid following treatment with ADLYXIN. A pooled analysis of studies of lisinatid-treated patients showed that 70% were antibody positive at Week 24. In the subset of patients (2.4 %) with the highest antibody concentrations (>100 nmol/L), an attenuated glycemic response was observed. A higher percentage of asymptomatic reactions and injection site reactions occurred in antibody positive patients [see Warnings and Precautions (5.1) and Adverse Reactions (6.2)].

If there is worsening glycemic control or failure to achieve targeted glycemic control, consider alternative antidiabetic therapy.

6.6 Infectious Disease
Given the nature of the diabetes disease state, patients taking ADLYXIN may be at an increased risk for infection. These should be managed as appropriate given the site and severity of the infection.

12-week treatment duration

Injection site reactions

Injection site reactions (e.g., pain, pruritus, and erythema) were reported more frequently in ADLYXIN-treated patients (4%) than placebo treated patients (2%). Anaphylaxis and hypersensitivity

In the ADLYXIN development program anaphylaxis cases were adjudicated. Anaphylaxis was defined as a skin or mucosal lesion of acute onset associated with at least 1 organ system involvement. Symptoms such as hypotension, laryngeal edema or severe bronchospasm could be present but were not required for the case definition. More cases adjudicated as meeting the definition for anaphylaxis occurred in ADLYXIN-treated patients (incidence rate of 0.2% or 16 cases per 10,000 patient years) than placebo treated patients (incidence rate of 0.1% or 7 cases per 10,000 patient years). Allergic reactions (such as anaphylactic reaction, angioedema and urticaria) adjudicated as possibly related to the study medication were observed more frequently in ADLYXIN-treated patients (0.4%) than placebo-treated patient (0.2%).

6.2 Immuneogenicity

In the pool of 9 placebo-controlled studies, 70% of patients exposed to lixisenatide tested positive for anti-lixisenatide antibodies during the trials. In the subset of patients (2.4%) with the highest antibody concentrations (>100 nmol/L), an attenuated glycemic response was observed. A higher incidence of allergic reactions and injection site reactions occurred in antibody positive patients [see Warnings and Precautions (5.6)]. Anti-lixisenatide antibody characterization studies have demonstrated the potential for development of antibodies cross-reactive with endogenous GLP-1 and glucagon, but the clinical significance of these antibodies is not currently known. The detection of antibody formation is highly dependent on the sensitivity and specificity of the assay. Additionally, the observed incidence of antibody (including neutralizing antibody) positivity in an assay may be influenced by several factors including assay methodology, sample handling, timing of sample collection, concomitant medications, and underlying disease. For these reasons, the incidence of antibodies to lixisenatide cannot be directly compared with the incidence of antibodies with other products.

7 DRUG INTERACTIONS

7.1 Delayed Gastric Emptying Effects on Oral Medications

ADLYXIN delays gastric emptying which may reduce the rate of absorption of orally administered medications. Use caution when coadministering oral medications that have a narrow therapeutic ratio or that require careful clinical monitoring. These medications should be adequately monitored when concomitantly administered with ADLYXIN. If such medications are to be administered with food, patients should be advised to take them with a meal or in a liquid when ADLYXIN is not administered.

Oral medications that are particularly dependent on threshold concentrations for efficacy such as antibiotics, or medications for which a delay in effect is undesirable, such as acetylsaligenphen, should be administered at least 1 hour before ADLYXIN injection [see Clinical Pharmacology (12.3)].

Patients taking oral contraceptives should be advised to take them at least 1 hour before ADLYXIN administration or at least 11 hours after the dose of ADLYXIN [see Clinical Pharmacology (12.3)].

7.2 Dose Adjustment of Sulfonylurea or Insulin with Concomitant Use with ADLYXIN

When initiating ADLYXIN, consider reducing the dose of concomitantly administered insulin secretagogues (such as sulfonylureas) or insulin to reduce the risk of hypoglycemia [see Warnings and Precautions (5.4) and Adverse Reactions (6.1)].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy Risk Summary

The limited available data with lixisenatide in pregnant women are not sufficient to inform a drug-associated risk of major birth defects and miscarriage. There are risks to the mother and fetus associated with poorly controlled diabetes in pregnancy [see Clinical Considerations]. Based on animal reproduction studies, there may be risks to the fetus from exposure to lixisenatide during pregnancy. ADLYXIN should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Lixisenatide administered to pregnant rats and rabbits during organogenesis was associated with visceral closure and skeletal defects at systemic exposures that decreased maternal food intake and weight gain during gestation, and that are 1-time and 6-times, respectively higher than the 20 mcg/day clinical dose, respectively, based on plasma AUC [see Data].

The estimated background risk of major birth defects is 6–10% in women with pregestational diabetes with a HbA1c >7 and has been reported to be as high as 20%–25% in women with a HbA1c >9. The estimated background risk of miscarriage for the indicated population is 2%–4% and 15%–20%, respectively.

Clinical Considerations

Drug-associated maternal and/or embryo/fetal risk

Poorly controlled diabetes in pregnancy increases the maternal risk for diabetic ketoacidosis, pre-eclampsia, spontaneous abortions, preterm delivery, and delivery complications. Poorly controlled diabetes increases the risk for major birth defects, stillbirth, and macrosomia related morbidity.

Data

Animal data

In pregnant rats receiving twice daily subcutaneous doses of 2.5, 25, 250 mcg/kg during organogenesis (gestation day 6 to 17), fetuses were present with visceral closure defects (e.g., microphthalmia, bilateral anophthalmia, diaphragmatic hernia) and stunted growth. Impaired ossification associated with skeletal malformations (e.g., bent limbs, scapula, clavicle, and pelvis) were observed at ≥5 mcg/kg/day, resulting in systemic exposure that is 1.5–15 times the 20 mcg/day clinical dose, based on plasma AUC. Decreases in fetal body weight, food consumption, and motor activity were observed concurrent with the adverse fetal findings, which confounds the interpretation of relevance of these malformations to the human risk assessment. Placental transfer of lixisenatide to developing rat fetuses is low with a concentration ratio in feto/maternal plasma of <0.5%. In a second study in pregnant rabbits, no drug-related malformations were observed from twice daily subcutaneous doses of 0.15, 1.0, and 2.5 mcg/kg administered during organogenesis, resulting in systemic exposures up to 9-times the clinical exposure at 20 mcg/kg, based on plasma AUC.

In pregnant rats given twice daily subcutaneous doses of 2.0, 20, or 200 mcg/kg from gestation day 6 through lactation, decreases in maternal body weight, food consumption, motor activity were observed at all doses. Skeletal malformations and increased pup mortality were observed at 200 mcg/kg/day, which is approximately 200-times the 20 mcg/day clinical dose, based on mg/m².

8.2 Lactation Risk Summary

There is no information regarding the presence of ADLYXIN in human milk, the effects on the breastfed infant, or the effects on milk production. However, lixisenatide is present in rat milk [see Data]. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for lixisenatide and any potential adverse effects on the breastfed infant from lixisenatide or from the underlying maternal condition.

Data

Animal data

A study in lactating rats showed low (9.4%) transfer of lixisenatide and its metabolites into milk and negligible (0.01%) levels of unchanged lixisenatide protein in the gastric contents of weaning offspring.

8.4 Pediatric Use

Safety and effectiveness of ADLYXIN have not been established in pediatric patients.

8.5 Geriatric Use

In clinical studies of ADLYXIN, a total of 1837 (25%) of the patients exposed to the study medication were 65 years of age and over and 288 (4%) were 75 years of age and over. No overall differences in safety or effectiveness were observed between these patients and younger patients, but individual sensitivity cannot be ruled out.

8.6 Renal Impairment

In patients with mild renal impairment (eGFR: 60–89 mL/min/1.73 m²) no dose adjustment is required in patients with moderate renal impairment [see Clinical Pharmacology (12.3)]. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for lixisenatide and any potential adverse effects on the breastfed infant from lixisenatide or from the underlying maternal condition.

Data

In pregnant rabbits receiving twice daily subcutaneous doses of 30 to 60 mL/min/1.73 m² no dose adjustment is recommended in patients with moderate renal impairment [see Clinical Pharmacology (12.3)].

There is no information regarding the presence of ADLYXIN in human milk, the effects on the breastfed infant, or the effects on milk production. However, lixisenatide is present in rat milk [see Data]. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for lixisenatide and any potential adverse effects on the breastfed infant from lixisenatide or from the underlying maternal condition.

Clinical experience in patients with severe renal impairment is limited as there were only 11 patients with severe renal impairment who received ≥20 mg/day of lixisenatide during the development program (see Warnings and Precautions [5.5]).

Clinical experience in patients with end stage renal disease (eGFR <15 mL/min/1.73 m²) is required because this may lead to dehydration and acute renal failure and worsening of chronic failure in these patients [see Warnings and Precautions (5.5)].

8.7 Patients with Gastrointestinal

ADLYXIN slows gastric emptying. Patients with preexisting gastroparesis were excluded from clinical trials of ADLYXIN. ADLYXIN should not be initiated in patients with severe gastroparesis.

10 OVERDOSAGE

In case of overdose, appropriate supportive treatment should be initiated according to the patient’s clinical signs and symptoms.

11 DESCRIPTION

Lixisenatide is a synthetic analogue of human GLP-1 and acts as a GLP-1 receptor agonist. Lixisenatide is a protein containing 44 amino acids, which is amidated at the C-terminal amino acid (position 44) and has a molecular weight of 4.8585 kDa. ADLYXIN (lixisenatide) injection is a sterile, clear and colorless solution for subcutaneous use. ADLYXIN is supplied as 3 mL single-patient-use prefilled pens. Each mL contains
After concomitant administration of ADLYXIN 20 mcg and ramipril 5 mg during 6 days, the AUC of ramipril was increased by 21% while the C_{max} was decreased by 63%. The AUC and C_{max} of the active metabolite (ramiprilat) were not affected. The t_{1/2} of ramipril and ramiprilat were delayed by approximately 2.5 hours.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis

Carcinogenicity studies of 2-years durations were conducted in CD-1 mice and Sprague- Dawley rats with twice daily subcutaneous doses of 40, 200, or 1,000 mcg/kg. A statistically significant increase in thyroid C-cell adenomas was observed in male mice at 2,000 mcg/kg/day, resulting in systemic exposures that are >180-times the human exposure achieved at 20 mcg/kg/day based on plasma AUC. Statistically significant increases in thyroid C-cell adenomas were seen at all doses in rats, resulting in systemic exposures that are >15-times the human exposure achieved at 20 mcg/kg/day based on plasma AUC. A numerical increase in thyroid C-cell carcinomas was observed in rats at <400 mcg/kg/day, resulting in systemic exposures that are >5-times the human exposure achieved at 20 mcg/kg/day based on plasma AUC.

Mutagenesis

Lixisenatide was not mutagenic or clastogenic in a standard battery of genotoxicity tests (bacterial mutagenicity (Ames), human lymphocyte chromosome aberration, mouse bone marrow micronucleus).

Impairment of Fertility

Studies in which male and female rats received twice daily subcutaneous doses of 2, 29, or 414 mcg/kg/dose prior to pairing through gestation day 6 did not indicate any adverse effects on male or female fertility in rats up to the highest dose tested, 414 mcg/kg/dose, which is approximately 400-times the clinical dose at 20 mcg/kg/day based on mcg/m².

14 CLINICAL STUDIES

ADLYXIN has been studied as monotherapy, in combination with oral antidiabetic medications, and in combination with basal insulin (with or without oral antidiabetic medications). The efficacy of ADLYXIN was compared with placebo, exenatide, and insulin glulisine.

In patients with type 2 diabetes, ADLYXIN produced reductions from baseline in HbA1c compared to placebo.

14.1 Monotherapy

In a 12-week double blind study, 241 patients with type 2 diabetes inadequately controlled on diet and exercise were randomized to ADLYXIN 20 mcg once daily or placebo. The mean age of the study population was 53.9 years, and the mean duration of type 2 diabetes mellitus was 2.5 years; 91.0% were male, 72.6% were White, 2.5% were Black or African American, 22.0% were Hispanic, and 3.7% had an eGFR <60 mL/min/1.73 m². The mean BMI was 32 kg/m². Compared with placebo, treatment with ADLYXIN 20 mcg once daily resulted in statistically significant reductions in HbA1c from baseline at Week 12 (see Table 3). The adjusted mean change in weight from baseline did not differ significantly between ADLYXIN (-1.9 kg) and placebo (-2.0 kg).

*Using multiple imputation with respect to jump to placebo for missing data at Week 12.

Patients with missing HbA1c value at Week 12 were considered nonresponders.

14.2 Add-on Combination Therapy to Metformin (Alone or in Combination with Sulfonylureas)

In a 24-week study, 323 patients with type 2 diabetes inadequately controlled on diet, exercise, and metformin were randomized to ADLYXIN 20 mcg once daily or placebo. The mean age of the study population was 56.7 years, and the mean duration of type 2 diabetes mellitus was 9.9 years; 44.8% were male, 90.1% were White, 10.0% were Black or African American, 27.9% were Hispanic, and 1.2% had an eGFR <60 mL/min/1.73 m². The mean BMI was 33 kg/m². The mean dose of metformin was 1955 mg per day. Compared with placebo, treatment with ADLYXIN 20 mcg once daily resulted in statistically significant reductions in HbA1c from baseline at Week 24 (see Table 4).
In a 24-week study, 391 Asian patients with type 2 diabetes inadequately controlled on diet, exercise, and metformin with or without a sulfonylurea were randomized to ADLYXIN 20 mcg once daily or placebo. The mean age of the study population was 57.4 years, and mean duration of type 2 diabetes mellitus was 9.3 years. The mean BMI was 27 kg/m². The mean dose of metformin was 1368 mg per day and 44.8% of patients were on a sulfonylurea. The two most common sulfonylureas used were glimepiride and glibenclamide and the mean dose of these drugs at baseline was 5.1 mg and 12.9 mg, respectively, and 84.4% of patients were on metformin.

Compared with placebo, treatment with ADLYXIN 20 mcg once daily resulted in statistically significant reductions in HbA1c from baseline at Week 24 (see Table 5).

| LS mean change from baseline † | -1.12 | -1.36 |

**ITT population = all randomized patients.**

†Using multiple imputation with respect to jump to placebo for missing data at Week 24 in the ADLYXIN group.

‡Patients with missing HbA1c value at Week 24 were considered nonresponders.

In a 24-week open-label study, 634 patients with type 2 diabetes inadequately controlled on diet, exercise and metformin were randomized to ADLYXIN 20 mcg once daily or exenatide 10 mcg twice daily. The mean age of the study population was 57.4 years, and mean duration of type 2 diabetes mellitus was 6.8 years; 53.3% were male, 92.7% were White, 2.8% were Black or African American, 26.8% were Hispanic, and 1.7% had an eGFR <60 mL/min/1.73 m². The mean BMI was 34 kg/m². The mean dose of metformin was 2039 mg per day.

ADLYXIN 20 mcg once daily met the prespecified noninferiority margin of 0.4% versus exenatide 10 mg BID for the difference in HbA1c reduction from baseline (see Table 6). However, in this study, ADLYXIN provided less HbA1c reduction than exenatide 10 mg BID and the difference was statistically significant (p=0.0175).

14.3 Add-on Combination Therapy to a Sulfonylurea (Alone or in Combination with Metformin)

In a 24-week study, 859 patients with type 2 diabetes inadequately controlled with diet, exercise and a sulfonylurea with or without metformin were randomized to ADLYXIN 20 mcg once daily or placebo. The mean age of the study population was 57.2 years, and mean duration of type 2 diabetes mellitus was 6.6 years. 45.1% were male. All patients were Asian. 2.8% had an eGFR <60 mL/min/1.73 m². The mean BMI was 27 kg/m². The mean dose of metformin was 1368 mg per day and 44.8% of patients were on a sulfonylurea. The two most common sulfonylureas used were glimepiride and glibenclamide and the mean dose of these drugs at baseline was 5.1 mg and 12.9 mg, respectively, and 84.4% of patients were on metformin.

Compared with placebo, treatment with ADLYXIN 20 mcg once daily resulted in statistically significant reductions in HbA1c from baseline at Week 24 (see Table 7).

14.6 ELIXA Cardiovascular Outcome Study

The ELIXA study was a randomized, double-blind, placebo-controlled, multinational study that evaluated cardiovascular (CV) outcomes during treatment with ADLYXIN in patients with type 2 diabetes mellitus after a recent Acute Coronary Syndrome event. The primary composite endpoint was the time to the first occurrence of a major adverse cardiovascular event or MACE+, defined as any of the following positively adjudicated events: Cardiovascular death, nonfatal myocardial infarction, or nonfatal stroke, or hospitalization for unstable angina. The study was designed as a noninferiority trial with a prespecified risk margin of 1.3 for the hazard ratio comparing ADLYXIN to placebo.

Overall, 6068 patients were randomized 1:1 to either placebo or ADLYXIN 20 mcg (following a starting dose of 10 mcg during the first 2 weeks) and were included in the primary analyses. The demographics and baseline characteristics were well-balanced between treatments. The median age at study entry was 60 years. Approximately 69% of the patients were males and 75% were Caucasian. The majority of patients were either obese or overweight with a median BMI of 29.4 kg/m². The mean duration of diabetes was 9.3 years. More than 75% of patients had impaired renal function and more than 20% had an estimated GFR less than 60 mL/min/1.73 m². Use of CV medications at baseline was similar between treatments; platelet aggregation inhibitors (aspirin and/or clopidogrel) were used by 97.5% of patients, statins by 97.2%, ACE inhibitors and/or angiotensin II antagonists by 66.8%, and beta-blockers by 84.4%. Prior to study entry, 93.9% of patients used at least 1 glucose-lowering medication, including metformin (69.9%), sulfonylureas (37.3%) and insulin (47.6%). During the study, antidiabetic medications were adjusted by the investigators per the local standard of care.

Ninety-six percent of the patients in both treatment groups completed the study in accordance with the protocol, and the vital status was known at the end of the study for 99.0% and 98.6% of the patients in the ADLYXIN and placebo group, respectively. Median treatment duration was 22.4 months in the ADLYXIN group and 23.3 months in the placebo group, and the median duration of study follow-up was 25.8 and 25.7 months, respectively. The results of the primary composite cardiovascular endpoint are shown in Table 12. The hazard ratio (HR) for ADLYXIN versus placebo was 1.02, with an associated 2-sided 95% confidence interval (CI) of 0.89 to 1.17. The upper bound of this confidence interval, 1.17, excluded a risk margin larger than 1.3.

16 HOW SUPPLIED/STORAGE AND HANDLING

16.1 How Supplied

ADLYXIN (lixisenatide) injection is a clear and colorless solution supplied in a 3 mL single-patient-use pen.

The green starter pen is 50 mcg/mL and delivers 14 doses of 10 mcg. The burgundy maintenance pen is 100 mcg/mL and delivers 14 doses of 20 mcg.

16.2 Storage

Store at 2° to 8°C (36° to 46°F) protected from light.

Store vials and pens at 2° to 8°C (36° to 46°F) protected from light.

Avoid exposure to direct sunlight. Do not freeze.
The following packages are available:
- Starter Pack, NDC 0024-5745-02: For treatment initiation, Starter Pack contains 1 single-patient-use prefilled green pen of ADLYXIN 20 mcg (NDC 0024-5741-00) and 1 single-patient-use prefilled burgundy pen of ADLYXIN 20 mcg (NDC 0024-5740-00).
- Maintenance Pack, NDC 0024-5747-02: Contains 2 single-patient-use prefilled burgundy pens for ADLYXIN 20 mcg (NDC 0024-5740-00).

16.2 Storage and Handling
Prior to first use, ADLYXIN should be stored in a refrigerator, 36°F to 46°F (2°C to 8°C). Do not freeze. Keep the prefilled pen in the original package to protect it from light. After first use, store up to 86°F (30°C). Replace the pen cap after each use to protect from light. Discard pen 14 days after first use.

Do not use ADLYXIN if you:
- have or have had pancreatitis, stones in your gallbladder, or a history of alcoholism.
- have or have had kidney problems.
- have or have had pancreatitis, stones in your gallbladder, or a history of alcoholism.
- are allergic to lixisenatide or any of the ingredients in ADLYXIN.
- are breastfeeding or plan to breastfeed. It is not known if ADLYXIN passes into your breast milk. Talk with your healthcare provider if you are pregnant or plan to become pregnant while using ADLYXIN.
- are allergic to lixisenatide or any of the ingredients in ADLYXIN.
- are allergic to lixisenatide or any of the ingredients in ADLYXIN.
- are allergic to lixisenatide or any of the ingredients in ADLYXIN.
- are allergic to lixisenatide or any of the ingredients in ADLYXIN.

What is ADLYXIN?
ADLYXIN is an injectable prescription medicine that may improve blood sugar (glucose) control in adults with type 2 diabetes, when used with diet and exercise.
- ADLYXIN is not for use in people with type 1 diabetes.
- ADLYXIN has not been studied in people with a history of pancreatitis.
- ADLYXIN has not been studied in people who have a stomach problem that causes slow emptying of the stomach (gastroparesis). ADLYXIN is not for people with slow emptying of the stomach.
- It is not known if ADLYXIN is safe and effective in children.

Who should not use ADLYXIN?
Do not use ADLYXIN if you:
- are allergic to lixisenatide or any of the ingredients in ADLYXIN. See the end of this Medication Guide for a complete list of ingredients in ADLYXIN.

Symptoms of a severe allergic reaction with ADLYXIN may include:
- swelling of your face, lips, tongue, or throat
- problems breathing or swallowing
- severe rash or itching

Before using ADLYXIN, tell your healthcare provider about all of your medical conditions, including if you:
- have or have had pancreatitis, stones in your gallbladder, or a history of alcoholism.
- have or have had kidney problems.
- have severe problems with your stomach, such as delayed emptying of your stomach (gastroparesis) or problems with digesting food.
- are pregnant or plan to become pregnant. It is not known if ADLYXIN will harm your unborn baby. Tell your healthcare provider if you are pregnant or plan to become pregnant while using ADLYXIN.
- are breastfeeding or plan to breastfeed. It is not known if ADLYXIN passes into your breast milk. Talk with your healthcare provider about the best way to feed your baby while you use ADLYXIN.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins and herbal supplements.

Especially tell your healthcare provider if you take:
- antibiotics or the pain reliever acetaminophen. Take these medicines at least 1 hour before using ADLYXIN. If you must take these medicines, take them with a meal or a snack. You should not take these medicines at the same time that you take ADLYXIN.
- birth control pills that are taken by mouth (oral contraceptives). ADLYXIN may lower the amount of the medicine in your blood from your birth control pills and they may not work as well to prevent pregnancy. Take your birth control pill at least 1 hour before your injection of ADLYXIN or at least 11 hours after your ADLYXIN injection.
- other anti-diabetes medicines, especially sulfonylurea medicines or insulin.

Ask your healthcare provider if you are not sure if your medicine is listed above.

Know the medicines you take. Keep a list of them to show your healthcare provider and pharmacist each time you get a new medicine.
How should I use ADLYXIN?

- Read the detailed Instructions for Use that comes with your ADLYXIN for instruction on using the ADLYXIN pen and injecting ADLYXIN.
- ADLYXIN comes as a single-patient-use prefilled pen.
- Use ADLYXIN exactly as your healthcare provider tells you to. Do not change your dose unless your healthcare provider has told you to change your dose.
- Your healthcare provider should teach you how to inject ADLYXIN before you use it for the first time. If you have questions or do not understand the instructions, talk to your healthcare provider.
- Use ADLYXIN 1 time each day within 60 minutes (1 hour) before the first meal of the day and at the same time each day.
- If you miss a dose of ADLYXIN, take it within 1 hour before your next meal.
- Check the label on the pen each time you give your ADLYXIN injection to make sure you are using the correct medicine.
- You must activate each ADLYXIN pen before you use it for the first time.
- Do not re-use or share your needles with other people. You may give other people a serious infection, or get a serious infection from them.
- Inject your dose of ADLYXIN under the skin (subcutaneously) of your abdomen, thigh or upper arm. Do not inject into a vein.
- Change (rotate) your injection sites within the area you chose with each dose. Do not use the same spot for each injection.

What are the possible side effects of ADLYXIN?

ADLYXIN may cause serious side effects including:

- See “What is the most important information I should know about ADLYXIN?”
- Severe allergic reactions. Severe allergic reactions can happen with ADLYXIN. Stop taking ADLYXIN and get medical help right away if you have any symptoms of a severe allergic reaction. See “Who should not use ADLYXIN?”
- Low blood sugar (hypoglycemia). Your risk for getting low blood sugar is higher if you use ADLYXIN with another medicine that can cause low blood sugar, such as a sulfonylurea or insulin. The dose of your sulfonylurea or insulin medicine may need to be lowered while you use ADLYXIN. Signs and symptoms of low blood sugar include:
  - headache
  - dizziness
  - drowsiness
  - confusion
  - weakness
  - irritability
  - hunger
  - sweating
  - fast heartbeat
  - feeling jittery

Talk with your healthcare provider about how to treat low blood sugar.

Kidney problems (kidney failure). In people who have kidney problems, diarrhea, nausea, and vomiting may cause a loss of fluids (dehydration) which may cause kidney problems to get worse.

The most common side effects of ADLYXIN include:

- nausea
- vomiting
- headache

These are not all the possible side effects of ADLYXIN. Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store ADLYXIN?

- Store your new, unused ADLYXIN pen in the refrigerator at 36°F to 46°F (2°C to 8°C).
- After activation, store your ADLYXIN pen at room temperature no higher than 86°F (30°C).
- Do not freeze ADLYXIN pens and do not use ADLYXIN if it has been frozen.
- Protect the pen from light.
- Replace the pen cap after each use to protect the container window from light.
- After activation, use the ADLYXIN pen for up to 14 days. Throw away the used ADLYXIN pen after 14 days, even if there is some medicine left in the pen.
- Do not use ADLYXIN past the expiration date printed on the label of the carton and pen.
- Do not store the ADLYXIN pen with the needle attached. If the needle is left on, this might lead to contamination and cause air bubbles which might affect your dose of medicine.
- See the Instructions for Use about the right way to throw away the ADLYXIN pen.

Keep your ADLYXIN pen, pen needles, and all medicines out of the reach of children.

General information about the safe and effective use of ADLYXIN.

Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use ADLYXIN for a condition for which it was not prescribed. Do not give ADLYXIN to other people, even if they have the same symptoms that you have. It may harm them.

You can ask your pharmacist or healthcare provider for information about ADLYXIN that is written for health professionals.

What are the ingredients in ADLYXIN?

Active ingredient: lixisenatide

Inactive ingredients: glycerol 85%, metacresol, methionine, sodium acetate trihydrate, and Water for Injection, USP. Hydrochloric acid and/or sodium hydroxide may be added to adjust pH.

Manufactured by: sanofi-aventis U.S. LLC, Bridgewater, NJ 08807, A SANOFI COMPANY

For more information, go to www.ADLYXIN.com or call sanofi-aventis at 1-800-633-1610.

INSTRUCTIONS FOR USE

ADLYXIN® (ad-LIX-in) (lixisenatide)

Injection, for subcutaneous use

Starter pack - Contains 2 prefilled pens each with 14 doses.

One 10 microgram (mcg) pen, each dose contains 10 mcg in 0.2 mL.
One 20 microgram (mcg) pen, each dose contains 20 mcg in 0.2 mL.

Section 1 – Important Information

Read these instructions carefully before using your ADLYXIN pens. Keep this leaflet for future reference.

Do not share your ADLYXIN pen with other people, even if the needle has been changed. You may give other people a serious infection, or get a serious infection from them.

ADLYXIN pen information

- ADLYXIN comes as a single-patient-use prefilled pen for injection.
- Inject 1 dose per day.
- There is no need to measure each dose.
- Talk with your healthcare provider about how to use the ADLYXIN pen and to inject correctly before using it.
• If you cannot follow all the instructions completely on your own or are not able to handle the pen (for example, if you have vision problems), only use it if you have help.

About Your ADLYXIN Starter Pack
The ADLYXIN Starter pack includes 2 different colored pens that contain different strengths of ADLYXIN. Both pens are used in the same way.
• The green pen contains 14 pre-set doses. Each dose contains 10 mcg of ADLYXIN.
• The burgundy pen contains 14 pre-set doses. Each dose contains 20 mcg of ADLYXIN.
You must start your treatment with the green 10 mcg ADLYXIN pen. You must first use all 14 doses from this pen. Then use the burgundy 20 mcg ADLYXIN pen.

About Your ADLYXIN Pens
Green 10 mcg ADLYXIN pen

• Always check the label to make sure you have the correct ADLYXIN pen. Also, check that it has not passed the expiration date printed on the ADLYXIN pen. Do not use ADLYXIN past the expiration date. Using the wrong medicine could be harmful to your health.
• Inject ADLYXIN only by using this pen injector. Never use a syringe to withdraw ADLYXIN from the pen.

About your pen needles (supplied separately)

• Pen needles are not included with your pen.
• Always use a new needle for each injection. This helps prevent contamination of ADLYXIN or possible needle blockage.
• Only use needles that have been approved for use with ADLYXIN. The ADLYXIN pen may be used with certain pen needles from Becton Dickinson, Ypsomed, and Owen Mumford that are 8 mm long or shorter. Ask your healthcare provider which needle gauge and length is best for you.
• Do not reuse or share needles with another person.

Before activation (orange window) After activation (white window)

The plunger will move along the dose scale after each injection. In the example above, the dose number shows there are 13 injections left in the ADLYXIN pen.

Burgundy 20 mcg ADLYXIN pen

How to activate your new ADLYXIN pen
Step 1. Pull off the pen cap and check the pen
Step 2. Screw needle on and remove needle caps

• Always use a new needle for activation.
• Remove the protective seal from the outer needle cap.
• Line up the needle with the pen. Push the outer needle cap containing the needle straight onto the pen, then screw the needle on until secure.

• Pull off (do not unscrew) the outer needle cap.
  o Pull off the inner needle cap and throw it away.
  o Keep the outer needle cap to remove the needle later.
• Take care not to injure yourself when the needle is exposed.
Step 3. Pull the injection button out

The arrow in the window will be pointing towards the injection button. **Pull the injection button out firmly until it stops.**

The arrow will now be pointing towards the needle.

Step 4. Firmly press and hold the injection button to remove the liquid

- **Do not** inject into the body.
- Point the needle into a container (like a paper cup or tissue).
- **Firmly press the injection button all the way in** to discard the liquid. You may feel or hear a "click."
- Keep the injection button pressed in and **slowly count to 2**, which is equal to 2 seconds.
- If no liquid comes out of your pen, see the Questions and Answers section at the end of this Instructions for Use.
- Check that the activation window is now white.

Step 5. The pen is now ready for use.

- **Do not** activate this pen again.
- For your first injection, go directly to Section 3 – Step 3.
- **You do not** need to replace the needle between activation and first injection if you inject yourself immediately after activation.

Section 3 – Daily use of pen

Inject only 1 dose each day.

Check to make sure the activation window is white before continuing in this section.

Step 1. Pull off pen cap and check pen

Check the label on your pen to make sure you have the correct medicine.
Check the liquid. It should be clear and colorless with no particles. If not, do not use the pen. Call your healthcare provider. Small air bubbles in the liquid are normal. See the Questions and Answers section at the end of this Instructions for Use.
Check that the activation window is white. If it is orange, go to section 2.

Step 2. Attach a new needle and remove the needle caps

- **Always use a new needle** for each injection.
- Remove the protective seal from the outer needle cap.
- Line up the needle with the pen. Put the outer needle cap containing the needle straight on the pen, then screw the needle on until secure.
- **Pull off** (do not unscrew) the outer needle cap.
  - Pull off the inner needle cap and throw it away.
  - Keep the outer needle cap to remove the needle later.
- **Take care not to injure yourself when the needle is exposed.**

Step 3. Pull the injection button out

The arrow in the window will be pointing towards the injection button. **Pull the injection button out firmly until it stops.**

The arrow will now be pointing towards the needle.
Step 4. Choosing Injection Sites

Injection sites

ADLYXIN must be injected under the skin and can be injected in any of the areas shown above in blue. These areas include the thigh, abdomen, or upper arm. Ask your healthcare provider about how to inject correctly.

Step 5. Press and hold the injection button to inject the dose

- Grasp a fold of skin and insert the needle (see the Injection sites section about where to inject).
- Press the injection button all the way in. You may feel or hear a “click.”
- Keep the injection button pressed in, hold the pen in place and slowly count to 2, which is equal to 2 seconds, before you pull the needle out of the skin.

If you do not hold the injection button in or if you remove the injector too early you may not get the full dose.

Your dose has now been given. Pull the needle out of your skin.

Step 6. Remove and throw away needle after each injection

- Grip the widest part of the outer needle cap. Keep the needle straight and guide it into the outer needle cap.
- Then push firmly on.
- The needle can puncture the cap if it is recapped at an angle.

- Replace the pen cap.

- Put the needle in a puncture-resistant container (or as instructed by your healthcare provider).

Step 7. Repeat all steps in Section 3 for each injection.

Throw away a pen 14 days after activation, even if there is some medicine left.

After the green pen is thrown away continue to Section 4 to begin using the burgundy pen.

Section 4 – Moving to the burgundy pen

Completed use of the green 10 mcg pen

The green 10 mcg ADLYXIN pen is empty when the black plunger has reached “0” on the dose scale and the injection button cannot be pulled out fully.

After the green 10 mcg ADLYXIN pen is empty you must continue your treatment the next day using the burgundy 20 mcg ADLYXIN pen. This is used in exactly the same way.

Use of burgundy 20 mcg pen

Burgundy 20 mcg pen activation

The burgundy 20 mcg ADLYXIN pen must also be activated before use. Follow all steps in Section 2.

Burgundy 20 mcg pen use

To inject a dose with the burgundy 20 mcg ADLYXIN pen, follow all steps in Section 3. Repeat Section 3 for your daily injections until your pen is empty.

Table of activation and disposal

In the table write the date when you activated your pen and the date to throw it away 14 days later.

<table>
<thead>

Storage

General information

- Keep your ADLYXIN pens in a safe place out of the reach and sight of children.
- Protect your ADLYXIN pens from dust and dirt.
- Replace the pen cap after each use in order to protect the container window from light.
Before activation of the pen:
- Store your unused ADLYXIN pens in the refrigerator at 36°F to 46°F (2°C to 8°C).
- Do not freeze ADLYXIN pens and do not use ADLYXIN if it has been frozen.
- Allow your pen to warm at room temperature before using.

After activation of the pen:
- After activation, store your ADLYXIN pen at room temperature no higher than 86°F (30°C).
- Do not store your ADLYXIN pen with the needle attached. An attached needle might lead to contamination and may cause air bubbles which might affect your dose of medicine.
- After your ADLYXIN pen is activated it can be used for up to 14 days. Throw away a used ADLYXIN pen after 14 days. Do this even if there is some medicine left in the pen.

Throwing your pen away
- Replace the pen cap before throwing away (disposing of) your ADLYXIN pen.
- Put the used ADLYXIN pen in an FDA-cleared sharps disposal container right away after use. Do not throw away (dispose of) the ADLYXIN pen and loose needles in your household trash.
- If you do not have an FDA-cleared sharps disposal container, you may use a household container that is:
  - made of a heavy-duty plastic,
  - can be closed with a tight-fitting, puncture-resistant lid, without sharps being able to come out,
  - upright and stable during use,
  - leak-resistant, and
  - properly labeled to warn of hazardous waste inside the container.
- When your sharps disposal container is almost full, you will need to follow your community guidelines for the right way to dispose of your sharps disposal container. There may be state or local laws about how you should throw away used needles and syringes. For more information about safe sharps disposal, and for specific information about sharps disposal in the state that you live in, go to the FDA’s website at: http://www.fda.gov/safesharpsdisposal.
- Do not dispose of your used sharps disposal container in your household trash unless your community guidelines permit this. Do not recycle your used sharps disposal container.

Maintenance
- Handle your ADLYXIN pen with care.
- You can clean the outside of your ADLYXIN pen by wiping it with a damp cloth.
- Do not soak, wash, or put liquid on (lubricate) your ADLYXIN pen. This may damage it.
- If you think your ADLYXIN pen may be damaged, do not use it. Get a new one. Do not try to repair the pen.

Questions and Answers

What do I do if I forget to activate the ADLYXIN pen or inject myself before activation?
If you have injected yourself before activating the pen, do not correct this by giving yourself a second injection. Contact your healthcare provider for advice on checking your blood sugar.

What do I do if there are air bubbles in the container?
Small air bubbles in the container are normal and they will not harm you. Your dose will be correct and you can keep following the instructions. Contact your healthcare provider if you need help.

What do I do if no liquid comes out during activation?
The needle may be blocked or not properly attached. Remove the needle from the pen, attach a new needle, and repeat Step 4 and Step 5 of Section 2 only. If still no liquid comes out, your ADLYXIN pen may be damaged. Do not use this ADLYXIN Starter pack. Contact your healthcare provider for help.
Inject ADLYXIN only by using this pen injector. Never use a syringe to withdraw ADLYXIN from the pen.

About your pen needles (supplied separately)

- Pen needles are not included with your pen.
- Always use a new needle for each injection. This helps prevent contamination of ADLYXIN or possible needle blockage.
- Only use needles that have been approved for use with ADLYXIN. The ADLYXIN pen may be used with certain pen needles from Becton Dickinson, Ypsomed, and Owen Mumford that are 8 mm long or shorter. Ask your healthcare provider which needle gauge and length is best for you.
- Do not reuse or share needles with another person.

Section 2 – Getting Started

- Activate the pen on the same day as your first injection with your new pen.

First activate your new pen

- Before injecting the first dose of ADLYXIN, you must activate the new pen. This is a one-time process called “activation.”
- Activation is done to make sure that the pen is working correctly and that the dose for your first injection is correct.
- Do not repeat the activation process or you will not receive 14 doses from your ADLYXIN pen.

The pictures below show how the injection button of your pen changes after activation.

Before activation (orange window) After activation (white window)

The pen is not activated when the activation window is orange. The pen must be activated before injecting your first dose of ADLYXIN.

The pen is activated and ready for injections when the activation window is white.

How to activate your new ADLYXIN pen

Step 1. Pull off the pen cap and check the pen

- Check the liquid by looking through the container window. It should be clear and colorless with no particles. If not, do not use this pen. Contact your healthcare provider. Small air bubbles in the liquid are normal. See the Questions and Answers section at the end of these instructions for use.

Step 2. Screw needle on and remove needle caps

- Always use a new needle for activation.
- Remove the protective seal from the outer needle cap.
- Line up the needle with the pen. Push the outer needle cap containing the needle straight onto the pen, then screw the needle on until secure.

Step 3. Pull the injection button out

- Pull off (do not unscrew) the outer needle cap.
  - Pull off the inner needle cap and throw it away.
  - Keep the outer needle cap to remove the needle later.
- Take care not to injure yourself when the needle is exposed.

Step 4. Firmly press and hold the injection button to remove the liquid

- Do not inject into the body.
- Point the needle into a container (like a paper cup or tissue).
- Firmly press the injection button all the way in to discard the liquid. You may feel or hear a “click.”
- Keep the injection button pressed in and slowly count to 2, which is equal to 2 seconds.
• If no liquid comes out of your pen, see the Questions and Answers section at the end of this Instructions for Use.
• Check that the activation window is now white.

Step 5. The pen is now ready for use.
• Do not activate this pen again.

For your first injection, go directly to Section 3 – Step 3.
• You do not need to replace the needle between activation and first injection if you inject yourself immediately after activation.

Section 3 – Daily use of pen
Inject only 1 dose each day.
Check to make sure the activation window is white before continuing in this section.

Step 1. Pull off pen cap and check pen

Step 2. Attach a new needle and remove the needle caps

• Always use a new needle for each injection.
• Remove the protective seal from the outer needle cap.
• Line up the needle with the pen. Put the outer needle cap containing the needle straight on the pen, then screw the needle on until secure.
• Pull off (do not unscrew) the outer needle cap.
  o Pull off the inner needle cap and throw it away.
  o Keep the outer needle cap to remove the needle later.
• Take care not to injure yourself when the needle is exposed.

Step 3. Pull the injection button out

The arrow in the window will be pointing towards the injection button. Pull the injection button out firmly until it stops.

The arrow will now be pointing towards the needle.

Step 4. Choosing Injection Sites

ADLYXIN must be injected under the skin and can be injected in any of the areas shown above in blue. These areas include the thigh, abdomen, or upper arm. Ask your healthcare provider about how to inject correctly.

Step 5. Press and hold the injection button to inject the dose

• Grasp a fold of skin and insert the needle (see the Injection sites section about where to inject).
• Press the injection button all the way in. You may feel or hear a “click.”
• Keep the injection button pressed in, hold the pen in place and slowly count to 2, which is equal to 2 seconds, before you pull the needle out of the skin.

If you do not hold the injection button in or if you remove the injector too early you may not get the full dose.

Your dose has now been given. Pull the needle out of your skin.

Step 6. Remove and throw away needle after each injection

• Grip the widest part of the outer needle cap. Keep the needle straight and guide it into the outer needle cap.
• Then push firmly on.
• The needle can puncture the cap if it is recapped at an angle.
- Grip and squeeze the widest part of the outer needle cap. Turn your pen several times with your other hand to remove the needle.
- Try again if the needle does not come off the first time.

- Replace the pen cap.

- Put the needle in a puncture-resistant container (or as instructed by your healthcare provider).

**Step 7. Repeat all steps in Section 3 for each injection.**

**Throw away a pen 14 days after activation, even if there is some medicine left.**

### Table of activation and disposal

In the table, write the date when you activated your pen and the date to throw it away 14 days later.

**Storage**

**General information**

- Keep your ADLYXIN pen in a safe place out of the reach and sight of children.
- Protect your ADLYXIN pen from dust and dirt.
- Replace the pen cap after each use in order to protect the container from light.
- Protect the ADLYXIN pen from light.
- Do not use ADLYXIN after the expiration date, which is stated on the label and on the carton. The expiration date refers to the last day of that month.

**Before activation of the pen:**

- Store your unused ADLYXIN pens in the refrigerator at 36°F to 46°F (2°C to 8°C).
- Do not freeze ADLYXIN pens and do not use ADLYXIN if it has been frozen.
- Allow your pen to warm at room temperature before using.

**After activation of the pen:**

- After activation, store your ADLYXIN pen at room temperature no higher than 86°F (30°C).
- Do not store your ADLYXIN pen with the needle attached. An attached needle might lead to contamination and may cause air bubbles which might affect your dose of medicine.
- After your ADLYXIN pen is activated it can be used for up to 14 days. Throw away a used ADLYXIN pen after 14 days. Do this even if there is some medicine left in the pen.

**Throwing your pen away**

- Replace the pen cap before throwing away (disposing of) your ADLYXIN pen.
- Put the used ADLYXIN pen in an FDA-cleared sharps disposal container right away after use. Do not throw away (dispose of) the ADLYXIN pen and loose needles in your household trash.
- If you do not have an FDA-cleared sharps disposal container, you may use a household container that is:
  - made of a heavy-duty plastic,
  - can be closed with a tight-fitting, puncture-resistant lid, without sharps being able to come out,
  - upright and stable during use,
  - leak-resistant, and
  - properly labeled to warn of hazardous waste inside the container.
- When your sharps disposal container is almost full, you will need to follow your community guidelines for the right way to dispose of your sharps disposal container. There may be state or local laws about how you should throw away used needles and syringes. For more information about safe sharps disposal, and for specific information about sharps disposal in the state that you live in, go to the FDA’s website at: [http://www.fda.gov/safesharpsdisposal](http://www.fda.gov/safesharpsdisposal).
- Do not dispose of your used sharps disposal container in your household trash unless your community guidelines permit this. Do not recycle your used sharps disposal container.

**Maintenance**

- Handle your ADLYXIN pen with care.
- You can clean the outside of your ADLYXIN pen by wiping it with a damp cloth.
- Do not soak, wash, or put liquid on (lubricate) your ADLYXIN pen. This may damage it.
- If you think your ADLYXIN pen may be damaged, do not use it. Get a new one. Do not try to repair the pen.

**Questions and Answers**

**What do I do if I forget to activate the ADLYXIN pen or inject myself before activation?**

If you have injected yourself before activating the pen, do not correct this by giving yourself a second injection. Contact your healthcare provider for advice on checking your blood sugar.

**What do I do if there are air bubbles in the container?**

Small air bubbles in the container are normal and they will not harm you. Your dose will be correct and you can keep following the instructions. Contact your healthcare provider if you need help.

**What do I do if no liquid comes out during activation?**

The needle may be blocked or not properly attached. Remove the needle from the pen, attach a new needle, and repeat Step 4 and Step 5 of Section 2 only. If still no liquid comes out, your ADLYXIN pen may be damaged. Do not use this ADLYXIN pen. Contact your healthcare provider for help.

**What do I do if it is hard to press the injection button all the way in?**

The needle may be blocked or not properly attached. Pull the needle out of your skin and remove the needle from the pen. Attach a new needle and repeat Step 5 and Step 6 of Section 3 only. If it is still hard to press in the injection button, your ADLYXIN pen may be damaged. Do not use this ADLYXIN pen. Contact your healthcare provider for help.
